

Adsorption Clarifier Water Treatment Plant

Case Study Details

Camp Site	Design Occupancy	Water Use Rates	Total Water Use
	(# of persons)	(L/person-day)	(m3/day)
Mary River	200	360	72

In support of its mining operations at the remote Mary River project site on Baffin Island, NU, the Baffinland Iron Mines Corporation purchased an Adsorption Clarifier water treatment package to take water from a lake water source and produce potable water to sustain their onsite workers.

Given variable source water quality, and the need to consistently meet or exceed Canadian Drinking Water Quality Guidelines, H2Flow selected the Adsorption Clarifier system in order to achieve a balance between robustness of treatment, cost, and ease of operations.

The treatment package included raw and treated water storage tanks fabricated in 304 stainless steel and which respectively provided 36 and 24 hours of storage capacity, as well as start-up, commissioning, and operator training services (interconnecting piping and provision of the building to house the equipment was by others).
